Pending Nucleic Acid and Pending Amino Acid database searches generate two sets of results each. The Pending databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches. Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions .rnpm and .rnpn

Searches run against the Amino Acid Pending database produce two sets of results, with the extensions

.rapm and .rapn

Because they contain data that is confidential, the results of Pending database searches should not be left in the case.

Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.

Example 1; SEQ ID NO 1; 31pp; English.

The present sequence is the protein sequence of human recombinant gelatin is called protein Hu-1. This has a molecular weight of 18.4 kDa and an isoelectric point of 5.15. A claimed composition suitable as a substitute or plasma comprises a solution of saline and a protein having a colloid osmotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and at most 50 kDa and an claoser of soelectric point of less than 8. It is especially Hu-1 or Hu-deam ADW48393. The recombinant gelatin-like protein, or a dimer, trimer or ceteramer of the protein, is useful as a plasma expander that has a lower clearance rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-like proteins that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood samples containing 19E antibodies. The gelatin-like proteins can be covalently attached to

lower clearance rate

the polypeptide Hu-3, which has a molecular weight of approximately 54 kba and which contains multiple Gly-Xaa-Yaa triplets. In an example from the invention, recombinant Hu-3 was immobilised on polystyrene beads cusing a heterobifunctional crosslinking agent, and used in a spinner flask cell culture. A claimed process for the preparation of a cell culture support comprises the step of coating a microcarrier bead with cgelatine or gelatine-like protein having a molecular weight of about 40-cc 200 kba, and optionally further comprising the step of immobilising the cgelatine or gelatine-like protein on the microcarrier. In this process, more than 75%, preferably more than 85% and more preferably more than 95% of the gelatine or gelatine-like protein is recombinantly produced to obtain a material of uniform molecular weight and to reduce the risk of contamination with prions. A, claimed cell support consists of microbeads contamination with prions. A, claimed cell support consists of microbeads contamination with prions. A, claimed cell support consists of microbeads contamination with prions a riplets and containing at least 15% proline residues and less than 5% of hydroxyproline residues, with a molecular weight distribution showing a maximum between 40 and 200 kba, at least 50% of the protein molecules having a molecular weight within 2% of the maximum. Large-scale production of expressed products can be accomplished maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 99.5%; Score 1178; DB 8; Length 617; Best Local Similarity 100.0%; Pred. ```
protein Hu-13. This is a tetramer of human recombinant gelatin-like protein Hu-13. This is a tetramer of human recombinant gelatin-like protein Hu-1 ADM48390. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid commotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and at most 50 kDa and an case-lectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower coleramore rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to protectly regulation than presently used gelatin derivatives. Recombinant gelatin-companies that are in essance free of hydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the circulating a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, was obtained the serverse, thrombocytes and leukocytes, thrombocytes and leukocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                       The recombinant gelatin polypeptide is used to produce vaccine formulations of the invention. The recombinant human gelatin polypeptide is used to produce vaccine formulations of the invention. The recombinant human gelatin is non-immunogenic (therefore reducing anaphylactic reactions) and confers stability at ambient temperatures. The vaccine formulation comprises a vaccine formulated for the prevention of a disease selected from vaccinia virus (small pox), polio virus (Salk and Sabin), mamps, measles, rubella, diphtheria, tetanus, Varicella-Zoster (chicken pox/shingles), pertussis (whooping cough), Bacille Calmette-Geurin (BCG, tuberculosis), haemophilus influenzae meningitis, rabies, cholera, Japanese encephalitis virus, salmonella typhi, shigella, hepatitis A and B, adenovirus, yellow fever, foot and mouth disease, herpes simplex virus, respiratory syncytial virus, roctavirus, Dengue, West Nile virus, turkey herpes virus (Marek's disease), influenza and/or anthrax
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 108

The patent discloses recombinant human gelatin which is useful in various compositions including binding agents, emcapsulants, stabilising agents, film-forming agents, moisturising agents, emulsifiers, thickening agents, colloidal agents, adelive agents, pharmaccutical compositions, hard gel capsules, soft gel capsules, plasma expander, colloidal volume replacement materials, graft coatings, medical sponges, medical plugs, pharmaccutical stabilisers, micro-carriers, edible compositions, protein supplements, fat substitutes, nutritional compositions, protein supplements, fat substitutes, nutritional supplements, edible coatings, photographic compositions, cosmetic compositions for use in the laboratory. Pharmaccutical compositions and compositions for use in the laboratory. Pharmaccutical compositions compositions for use in the laboratory. Pharmaccutical compositions compositions for use in the laboratory. Pharmaccutical compositions conditions for use in the laboratory of cartilage and joint conditions such as arthritis, athrosis and other conditions related to the degeneration of cartilage and joint conditions such as arthriting also used in food and beverage industries. The present sequence is human alphal (1) type I collagen to helical domain (residues 179-679). This sequence is a recombinant gelatin in the sequence is a recombinant gelatin and the sequence is a recombinant gelatin and seque
protein supplement; fat substitute; nutritional supplement; cell culture; edible coating; cosmetic; vaccine; therapy; arthritis; athrosis; cartilage degeneration; joint flexibility; food industry; beverage;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            109 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 168

New vaccine composition comprising a recombinant gelatin and an antigenic agent, useful for preventing e.g. polio virus, mumps, measles, rubella, diphtheria, tetanus, chicken pox/shingles, pertussis, cholera, rotavirus WPI; 2003-540775/51

Claim 16; Page 36-38; 63pp; English.

The invention describes a vaccine composition comprising a recombinant gelatin, and an antigenic agent. The vaccine can be delivered by injection, through measl, oral, transdermal or mucosal routes, or through deep lung delivery. Administration may also be oral, rectal, transmucosal, intestinal, or parenteral (e.g. intramuscular, subcrutaneous, intramedullary, intrachecal, intravencinal, intravencinal (e.g. intravencinal, intravencinal), per provencinal spain (applied sably and sabin), mumps, meaales, rubella, diphtheria, tetanus, varicella-Zoster (chicken pox/shingles), pertussis (whopping cough), Bacille Calmette-Guerin (BCG, tuberculosis), Haemophilus (C. Salmonella typhi, Shigella hepatitis A, hepatitis B, adenovirus, yellow fever, foot and mouth disease, herpes simplex virus, respiratory syncytial virus, rotevirus, dengue, West Nile virus, Turkey herpes virus (Marek's disease), influenza, and anthrax. This is the amino acid sequence of a recombinant gelatin used in the creation of a vaccine composition of the invention.

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, cell with a hypertonic growth medium containing at least one amino acid, cell with a hypertonic growth medium containing at least one amino acid, cell with a hypertonic growth medium containing at least one amino acid, cell more the group consisting of trans-4-hydroxyproline and 3-c hydroxyproline and incorporated into the extracellular matrix protein. The nethod may be used to make host cells assimilate and incorporate trans-4-combinent production of proteins such as collagen, fibrinogen and combinent production of proteins such as collagen, fibrinogen and combined sepands on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of contain trans-4-processing and contain trans-4present sequence represents a human collagen 1 (alphal) protein, which may be produced using the method of the invention φ

The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises not ordinarily sequence for expression in the cell by substitution of codons preferred sequence for naturally occurring codons not preferred by the cell; incorporating the mucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acid, shydroxyproline to allow at least one of the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         417 GVMGFPGPKGAAGBPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEOGPA 476
hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibringen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents human collagen 1 (alphal) helical region, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a human type 1 (alpha1) collagen protein. Peptides derived from the protien were used to demonstrate incorporation

of 3,4-dehydro-L-proline into the peptide, using the method of the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroproline residue in the polypeptide with an epoxydation reagent from a polypeptide containing at least one 3,4-poxyproline residue. The method is used for studying the effects of non-natural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bioadhesives), and for incorporating a wide variety of groups, including therapeutic ligands and biological probes, into polypeptides

                                                                                                                                                                                                                              collagen 1(a) linked to amino acids 46-93 of human mature dermaran sulphate proteoglycan (decorin). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16518) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibrinogen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amino acid sequence of a chimeric collagen 1 (alpha1)/decorin protein.

The specification describes a method for producing an extracellular capable of self aggregating in a cell which does not ordinarily capable of self aggregating in a cell which does not ordinarily bydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred sequence for expression in the cell by substitution of codons preferred incorporating the nucleic acid sequence into the cell; and contracting the incorporating the nucleic acid sequence into the cell; and contracting the selected from the group consisting of trans-4-hydroxyproline and 3-cell with a hypertonic growth medium containing at least one amino acid, cell with a hypertonic prowth medium containing at least one amino acid, cell with a hypertonic prowth medium containing at least one amino acid, cell with a hypertonic to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The hydroxyproline into proteins. This is especially useful in the cacombinant production of proteins such as collagen, fibrinosen and production of proteins depended on the post translational hydroxylation of proline. The contain do not normally contain trans-4-hydroxyproline. The collagen sequence represents a chimeric collagen 1 (alphal)/decorin axx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          297 GPPGPAGEEGKRGARGEPGFTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 356

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        477
```

New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer or non-cancerous disease states of the pancreas.

Claim 12; SEQ ID NO 510; 635pp; English

```
This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, inaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                155 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 214
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 109 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 168

```

A fusion protein (AAR89469) comprises the alpha-helical region of human collagen I(a) linked to the human mature bone morphogenic protein 2B (BMP2B). It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16515) coding for the fusion. The BMP moiety induces osteogenesis, while the collagen moiety provides an integral substratum or scaffolding for the BMP and cells involved in reconstruction and growth. The fusion protein provides substances and delivery of BMP to a target tissue 97.0%; 93.6%; Sequence 1169 AA;

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarlly. Addroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the hydroxyproline into proteins. This is especially useful in the fibronectin whose ability to self aggregate and produce functional fibronectins depends on the post translational hydroxylation of proline. The
                                                                                        Extracellular matrix protein; self aggregation; hydroxylated proline; trans-4-hydroxyproline; 3-hydroxyproline; recombinant protein production; collagen; fibrinogen; fibronectin; post translational hydroxylation; ss. bone morphogenic protein; BMP-28; chimera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method is also useful in studying the structure and function of polypeptides which do not normally contain trans-4-hydroxyproline. The stressent sequence represents a chimeric collagen 1 (alphal)/bone morphogenic protein-2B (bmp-2b) protein, which may be produced using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Production of extracellular matrix proteins containing 4-trans-
hydroxyproline results in native self aggregating proteins, useful on
medical implants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 18, Application US/09548608

Patent No. 6355442

GENERAL INFORMATION:
APPLICANT: Gvist, Per
APPLICANT: Bonde, Martin
TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out the
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:

US-09-331-347C-21
US-09-331-347C-21
Sequence 21, Application US/09331347C
Facent No. 6617431
GENERAL INFORMATION:
APPLICANT: Meristem Therapeutics, S.A.
TITLE OF INVENTION: Recombinant Collagens and Derived Proteins Produced by Plants, Meristem Therapeutics, S.A.
TITLE OF INVENTION: Obtaining Such and Their Uses
FILE REFERENCE: 1149-3
CURRENT APPLICATION NUMBER: US/09/331,347C
CURRENT FILING DATE: 1999-08-17
NUMBER OF SEQ ID NOS: 22
SOFTWARE: Patentin version 3.1
                APPLICANT: Chang, Robert
APPLICANT: McMullin, Hugh
APPLICANT: McMullin, Hugh
APPLICANT: Hitzeman, Ronald A.
APPLICANT: Hitzeman, Ronald A.
APPLICANT: Chisholm, George
TITLE OF INVENTION: NOVEL METHODS FOR THE PRODUCTION OF GELATIN AND
TITLE OF INVENTION: FULL-LENGTH TRIPLE HELICAL COLLAGEN IN RECOMBINANT
TITLE OF INVENTION: CELLS
FILE REFERENCE: 225002030400
CURRENT APPLICATION NUMBER: US/09/289,578
CURRENT FILING DATE: 1999-04-10
PRIOR PLICATION NUMBER: 60/084,828
PRIOR PLICATION NUMBER: 60/084,828
NUMBER OF SEQ ID NOS: 11
SOFTWARE: Patentin Ver. 2.0

F; 24-121 Product: collagen alpha 1(III) chain #status predicted <PRO>
F; 154-167 Region: amino-terminal nonhelical telopeptide
F; 154-167 Region: collagen alpha 1(III) chain #status predicted <PRO>
F; 154-167 Region: collagen alpha 1(III) chain #status predicted <PRO-
F; 168-11093 Region: cell attachment (R-G-D) motif
F; 109-11093 Region: cell attachment (R-G-D) motif
F; 122-1466/Domain: helical
F; 123-1466/Domain: carboxyl-terminal nonhelical telopeptide
F; 123-1466/Domain: carboxyl-terminal propeptide #status predicted
F; 123-1466/Domain: dibrillar collagen carboxyl-terminal homology <PRO-
F; 124 Modified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status predicted
F; 124 Modified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status predicted
F; 124 Modified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status experimental
F; 125, 284, 860, 977, 1106/Modified site: 5-hydroxylysine (Lys) (partial) #status experimental
F; 148-149/Cleavage site: Gly-Ile (Collagenase) #status experimental
F; 148-149/Cleavage site: Gly-Ile (Collagenase) #status experimental
F; 148-149/Cleavage site: Gly-Ile (Collagenase) #status experimental

"Sequence of normal canine COLIA1 cDNA and identification of a heterozygous alphal. Il) collagen Gly208Ala mutation in a severe case of arch. Biochem. Biophys. 384.637-46(2000).
- FWCYION: Type I collagen is a member of group I collagen (fibrillar forming collagen).
- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
- PTM: Prolines at the third position of the tripeptide repeating unit (G-K-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DISEASE: Defects in COLIA1 are a cause of osteogenesis imperfecta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EMBL; AFIS3062; AAD34619.1; -.
